
Abstract
This pilot study assessed the feasibility and acceptability of a new quality of life (QOL) assessment and intervention methodology (AIM) for youth on dialysis and their caregivers. Thirty-nine patients and their caregivers participated in the QOL AIM, which incorporates patient-centered care practices to identify needs, choose interventions, and evaluate impact on QOL functioning. Participants found the QOL AIM to be feasible and acceptable, and were overall satisfied with perceived improvement in patient QOL functioning. The QOL AIM shows promise for QOL intervention planning.
